

NuLastic™ SILK-E ELASTOMERS

“Efficiency, Emulsification and Emollient Extended Wear”

NuLastic SILK-E-ID-LSA INCI Name: Isododecane (and) Polysilicone-23

The first in a series of high molecular weight silicone elastomers reacted with amino functional polyurethanes that deliver innovative chemical and physical properties. These unique polymers help provide multifunctional benefits in formulation development while delivering outstanding emolliency and other aesthetic features:

Formulation Efficiency

The amine component of the **NuLastic SILK-E ID-LSA** reacts under acidic conditions:

- unique polymeric neutralization
- can be combined with other neutralizers
- reacts with polyacrylate and other acids in water
- reduces the tack of polyacrylic acid hydrogels
- unique silicone gel form
- increases pH
- improves adhesion due to polymeric network

Emulsification Efficiency

After protonation, **NuLastic SILK-E ID-LSA** is rendered surface active in polyacrylic acid systems:

- compatibility with other emulsifiers
- water/silicone and water/silicone/water systems
- cationic co-emulsifier
- solubility with polar and non polar solvents and waxes

Emollient Extended Wear

Due to hydrogen bonding **NuLastic SILK-E ID-LSA** contributes to products that are **Transfer Resistant, Water Resistant and Long Wearing:**

- forms non-resinous waterproof permeable films
- allows diffusion onto-into the substrate
- creates a cohesive emollient matrix
- anchors the elastomer to the skin
- entraps and delivers actives, pigments, pearls and organics
- aids in pigment wetting and even color payout
- enhanced adhesion

Effectiveness at Low Polymer Concentrations

NuLastic SILK-E ID-LSA can be used with or without other cosmetic film formers:

End-Use Applications

NuLastic SILK-E ID-LSA elastomers can add durability and long wear properties to a wide range of products:

- Anhydrous Lip Gloss
- Emulsion Lip Gloss
- Lipsticks
- Anhydrous Foundations
- Mascaras
- Creams
- Liquid Make-up
- Pencils
- Lotions
